

115 Audio Routing Flow Diagram

Playback/Fault Finding:

The 115 system is relatively straight forward in it's routing.

We have now added an audio combiner for the front L/R speakers which allows us to use the external audio lead and computer audio without the need for switching.

Heres a quick guide for sound playback:

1. **For all audio playback you will need to turn on the sub and all speakers required.**
2. **External Playback (your laptop)**
 1. Plug the external lead into your computers headphone socket
 2. Turn up the volume and enjoy!
3. **Computer Playback**
 1. Turn on the audio interface and ensure it's plugged in to the iMac
 2. Ensure the audio interface is selected as the computers output (System Preferences/Sound)
 3. Turn up the volume and enjoy!

Not working? Try these:

1. Check the interface is plugged in
2. Check the Sub is On
3. Check the Interface Master Volume is up (volume knob on interface)
4. If using Logic check that the interface is set under Logic Pro X/Preferences/Audio

Still No Luck?? Contact avsupport.music@trinitylaban.ac.uk as soon as possible!
